(Image credit: Tom's Hardware)Our GPU pricing index shows just how overpriced the latest graphics cards are, if you're even willing to bother with eBay. Trying to sift through eBay sold listings while eliminating fake "here's a picture of a card" red herring takes some effort, but the clear trend is that every GPU that's even remotely useful for mining has shot up in price, dragging most recent GPUs along for the ride. But what's the best value if you simply have to buy a graphics card right now? Say hello to some old friends!Based on the performance we measured in our GPU benchmarks hierarchy, and combined with current (the past week) eBay prices, we generated an FPS-to-dollar metric to see which cards might be worth considering. The winner, as you've no doubt guessed from the headline, was Nvidia's relatively ancient GTX 970 card from late 2014. The GTX 970 sports the Maxwell architecture, with 5.2 billion transistors fabricated on TSMC's 20nm high-performance node. Those were good times! The chip also measures nearly 400mm square, and by way of comparison is larger than the Ampere GA100 chip used in the RTX 3070 and RTX 3060 Ti. That's not a great deal by any means, but it does represent the best FPS-to-right now. And if you get lucky, you might even score one for closer to \$125. How long will a five or six-year-old graphics card last? That's certainly a big part of the risk, but in absolute performance even aging Maxwell still performs okay—it's about slightly faster than Nvidia's GTX 1650, for example (not the 1650 Super or 1650 GDDR6, though).We're not suggesting most people try to buy such a GPU, but if you simply have to spend a lot of money, it's one of the better options right now. It can also manage over 60 fps at 1080p medium settings in most modern games, though obviously there are exceptions. There are other "oldies but goodies" (sort of good, anyway) to consider, like the GTX 980 and R9 390, but prices on the latter are back above \$300. AMD's RX 570 4GB ranks as the second-best GPU using the same metrics, with a median price of \$225. And those cards are likely much newer—but possibly used for 24/7 mining, so don't count on getting a pristine GPU either very here's the full list of graphics cards with their accompanying performance that we've sorted by FPS/S. You can see the relative performance rank in the far right column as well.(Prices and performance testing current as of March 2, 2021.) We've attempted to eliminate false and 'fake' listings, so these are only the sold listings (which can still be incorrect in some cases), but the trends are easy enough to see. The good news is that at least some of the most desirable cards appear to have peaked and are now starting to decline in prices. Fingers crossed, it's also interesting to see which cards are the most popular on eBay. Obviously the new Ampere GPUs are near the top of the list, but Pascal GPUs continue to sell a lot of units as well.
